50Days-coding-challenge

Day-22[Python]

Sales Data Analysis (Variables & Data Types)

Name:M NITHIN

Scenario

You are a data analyst working for an e-commerce company. You receive raw sales data for a single order, and your task is to process it using Python variables and data types.

Objective

Use **Python variables and data types** to:

- Store data
- Perform calculations
- Format outputs

Given Data

order_id = "ORD12345"
customer_name = "Rahul”
product_price = 799.99
quantity = 3
discount = 0.10
is_member = True

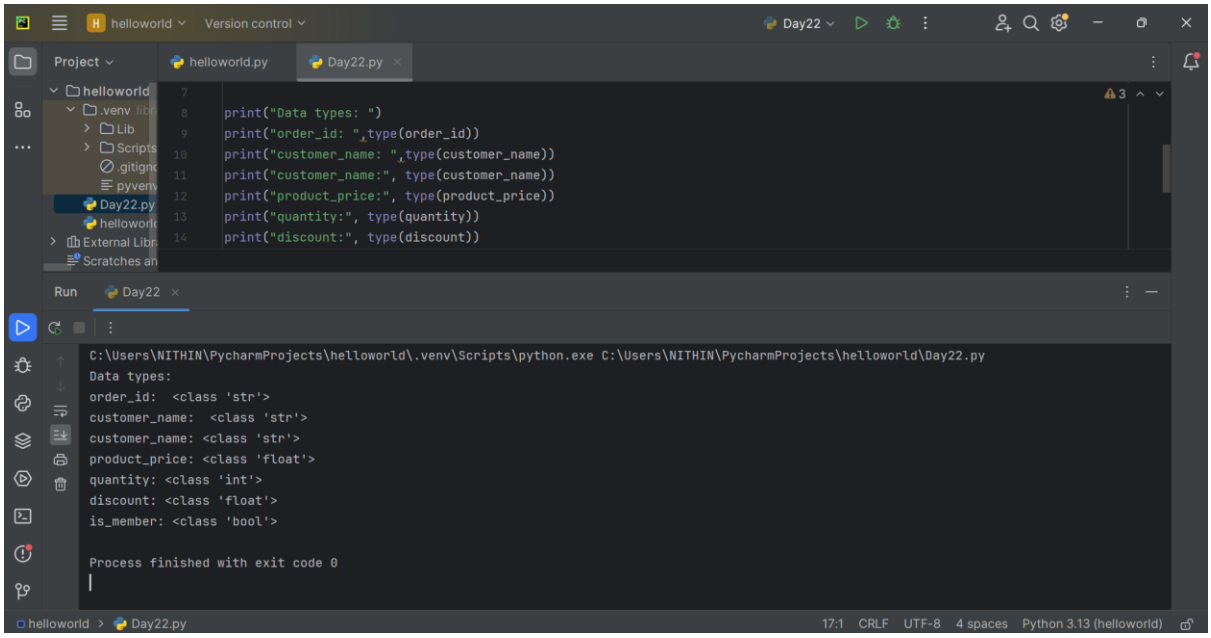
Tasks

Task 1: Declare the variables and assign the values as above with appropriate

```python
order_id = "ORD12345"          #string
customer_name = "Rahul"        #string
product_price = 799.99         #float
quantity = 3                   #int
discount = 0.10                #float
is_member = True               #boolean
```

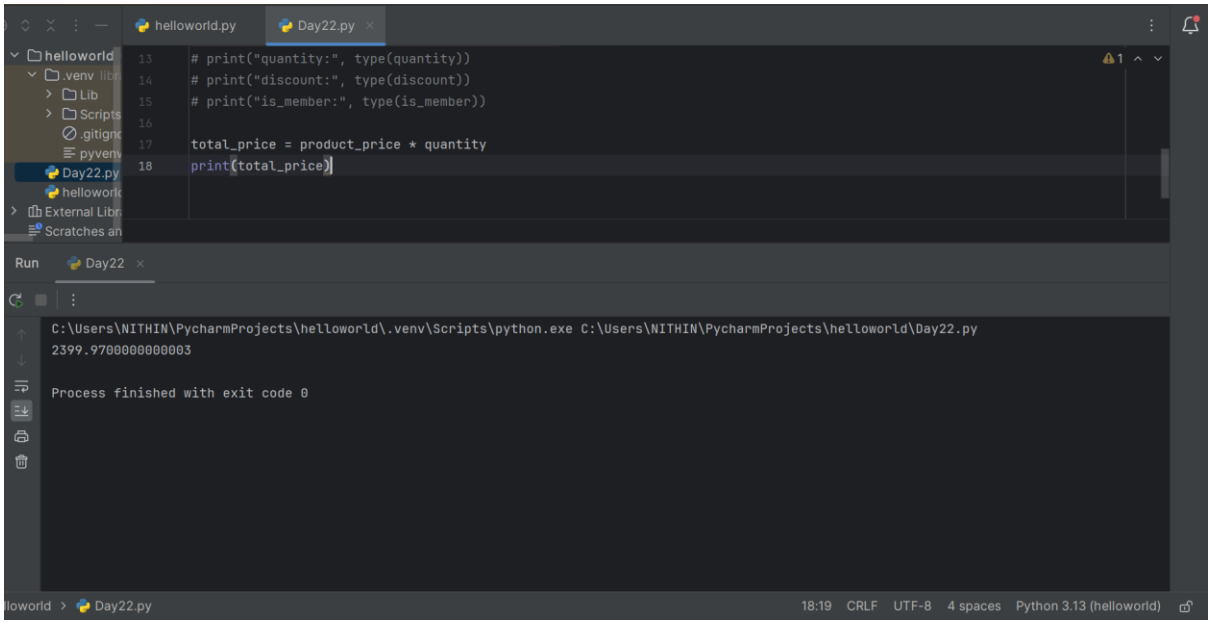
Data Type Task 2: Identify Data Types

Print the data type of each variable using type().



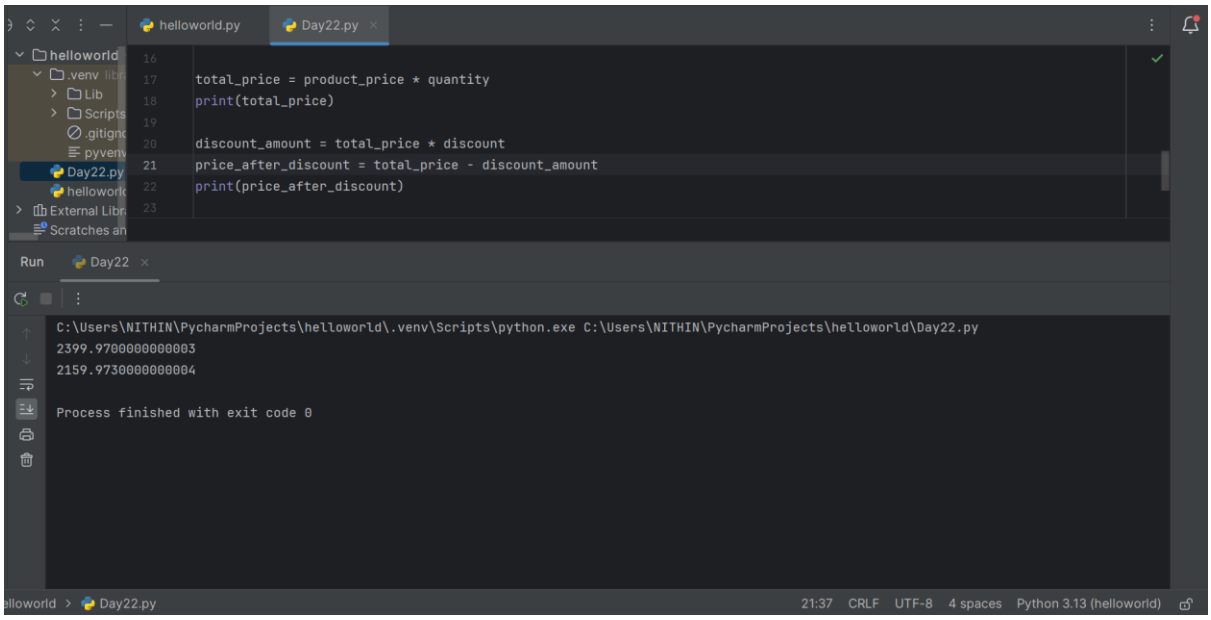
Task 3: Calculate Total Price

- Total price before discount



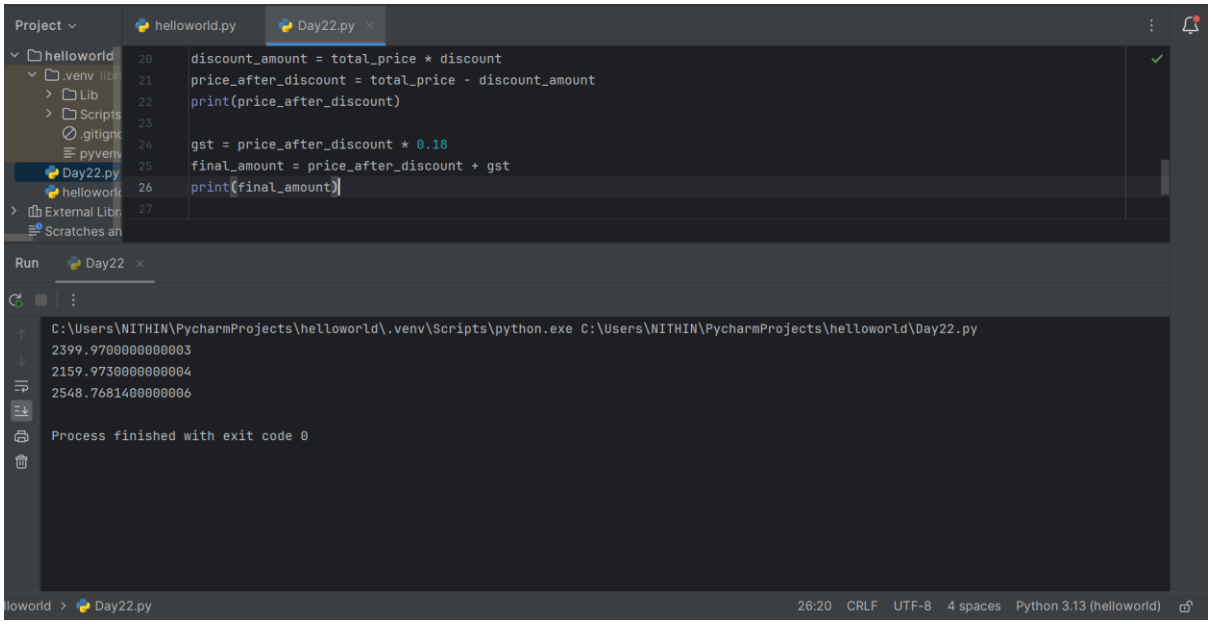
Task 4: Apply Discount

Total price after discount



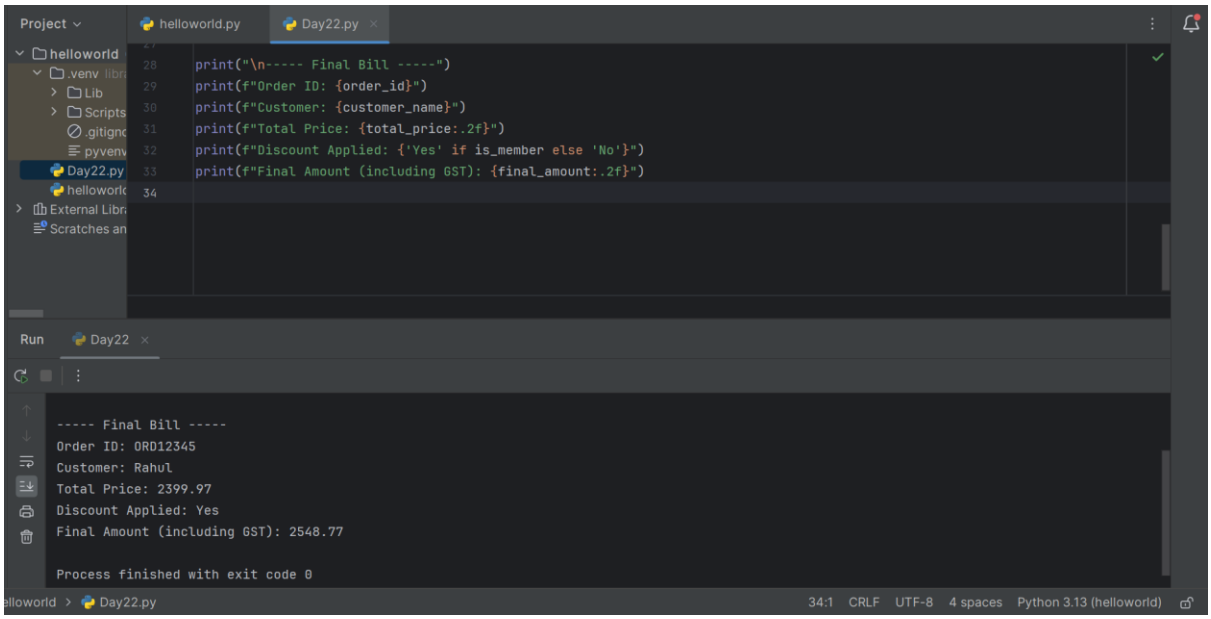
Task 5: Add GST (18%)

- Calculate GST on the final price
- Add it to get the final bill amount



Task 6: Display Output

Print the final bill in a clean format:

Example:


Order ID: ORD12345
Customer: Rahul
Total Price: 2399.97
Discount Applied: Yes
Final Amount (including GST): XXXX
