50Days-coding-challenge

Day-31[Python]

Smart Expense Analyzer

Name:M NITHIN

Objective

Use **Python operators** (arithmetic, comparison, logical, and assignment) to analyze a user's monthly expenses and determine financial status.

Problem Statement

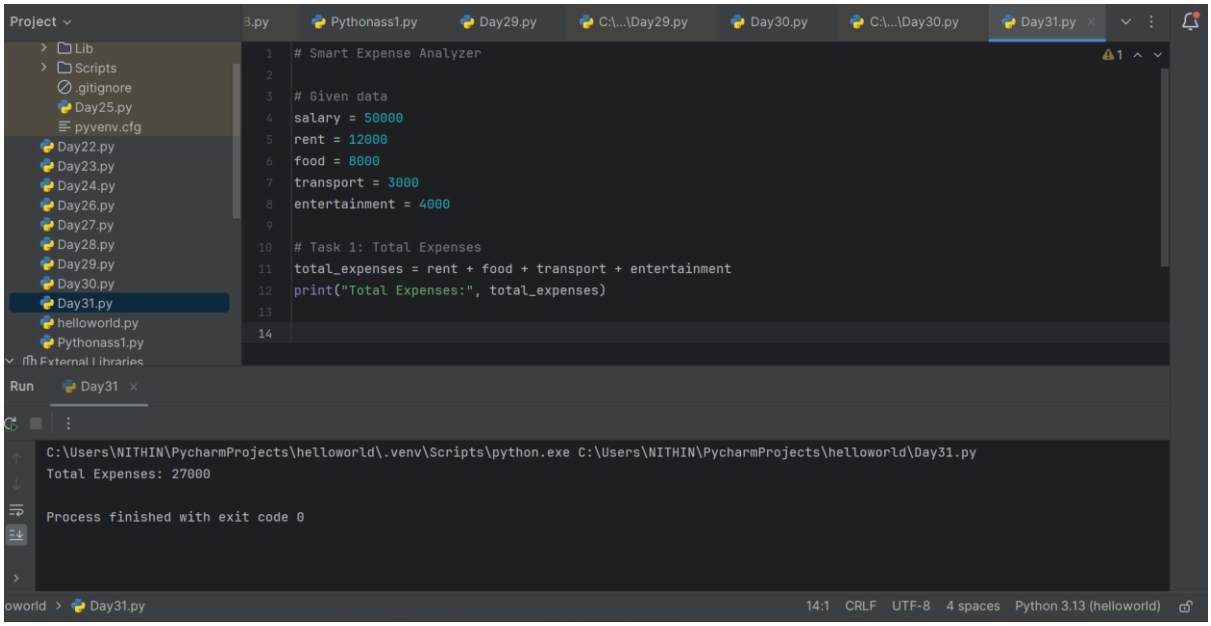
You are given the following data:

salary = 50000 rent = 12000 food = 8000 transport = 3000 entertainment = 4000

Tasks

Task 1: Total Expenses

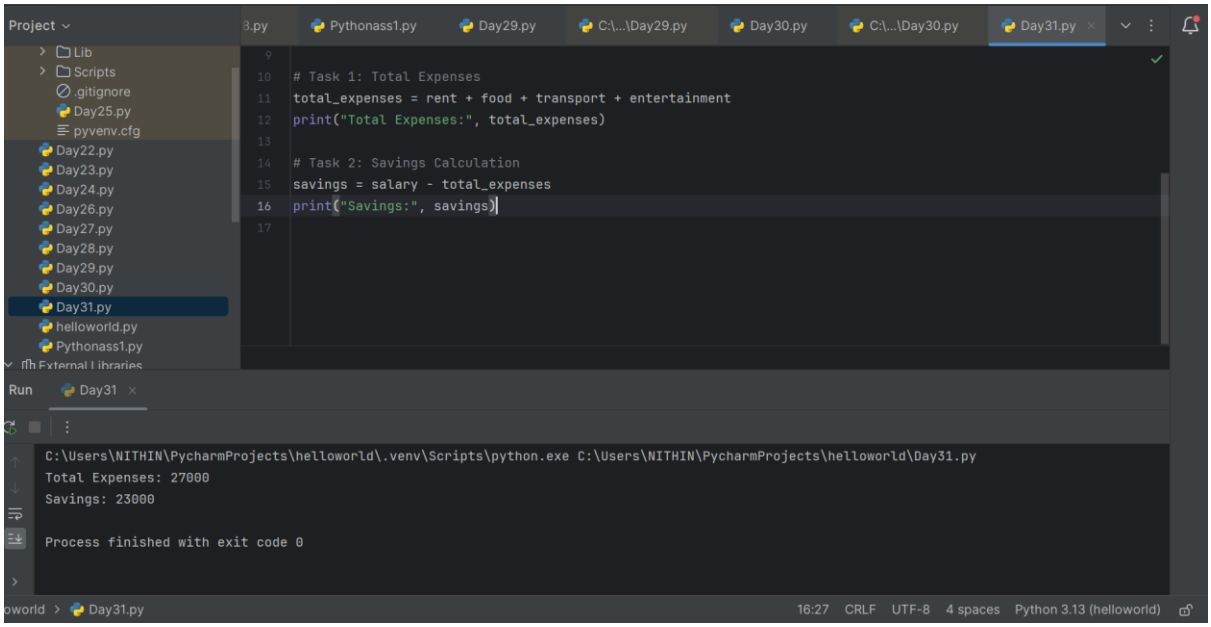
- Use **arithmetic operators** to calculate total expenses.



Task 2: Savings Calculation

- Calculate savings using:

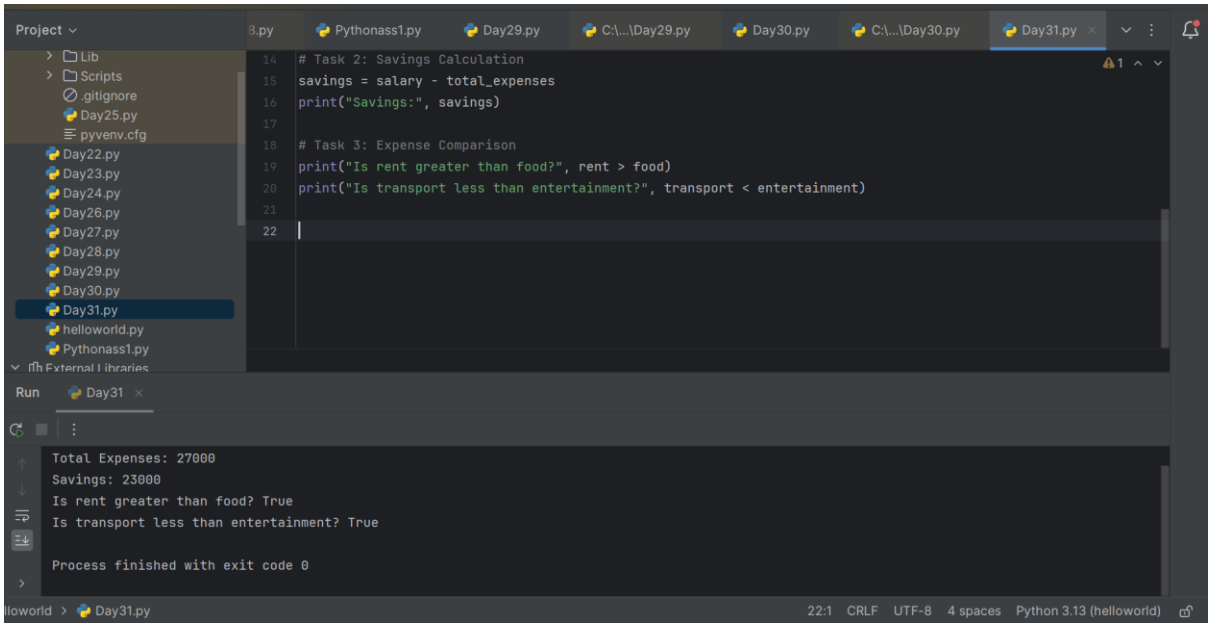
savings = salary - total_expenses



Task 3: Expense Comparison

- Check:
  - Is rent greater than food expense?
  - Is transport less than entertainment?

Use **comparison operators**.



Task 4: Financial Condition Check

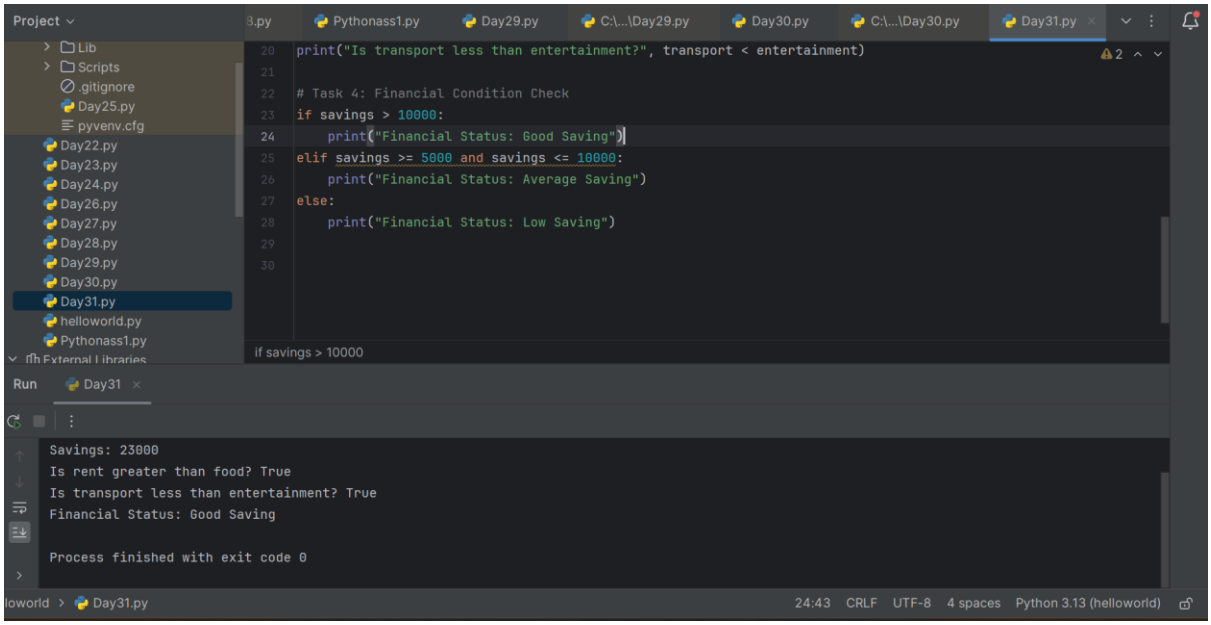
If savings:

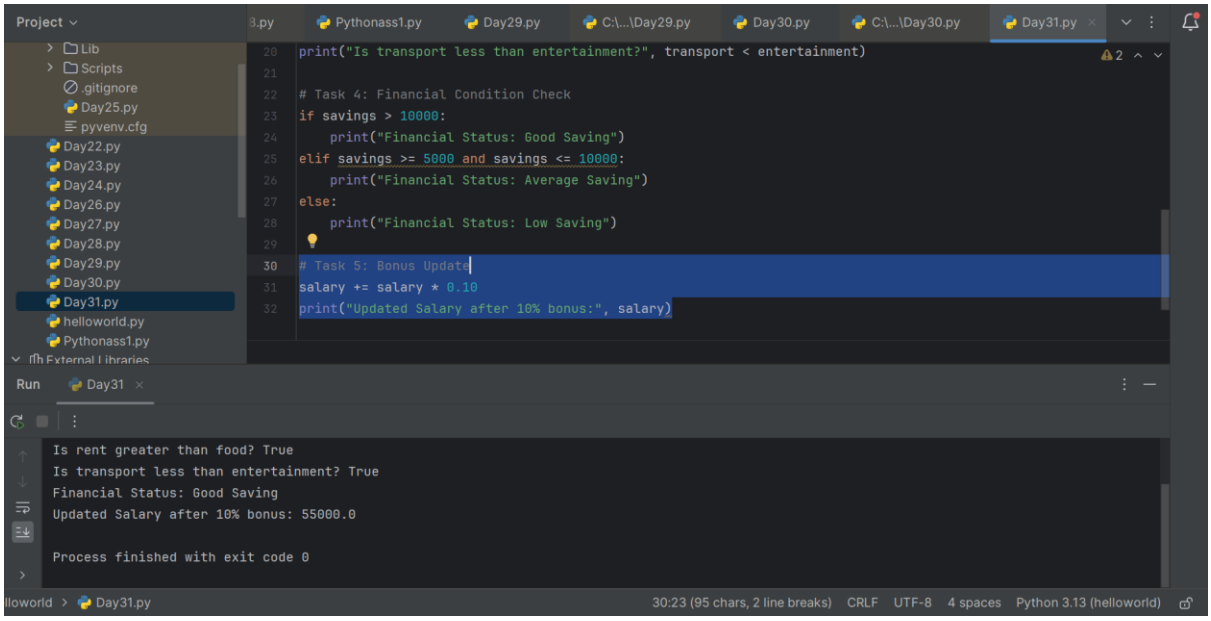
o Greater than 10,000 → "Good Saving"

o Between 5,000 and 10,000 → "Average Saving"

o Less than 5,000 → "Low Saving"

Use **logical operators (and, or)**.



Task 5: Bonus Update


- Increase salary by 10% using **assignment operators**: salary += salary * 0.10
